

greatest common factor

GCF: the biggest # that 2 numbers have in common

$$8 \& 10 : \cdot 8 = 1, \textcircled{2}, 4, 8$$
$$\cdot 10 = 1, \textcircled{2}, 5, 10$$

$$\boxed{\text{GCF} : 2}$$

$$30 \& 45 : \cdot 30 = 1, 2, 3, 5, 6, 10, \textcircled{15}, 30$$
$$\cdot 45 = 1, 3, 5, 9, \textcircled{15}, 45$$

$$\boxed{\text{GCF} : 15}$$

* The GCF with variables is the SMALLEST amount they both have *

$$x^2 \& x^4 : \cdot x^2 = \textcircled{x \cdot x}$$
$$\cdot x^4 = \textcircled{x \cdot x} \cdot x \cdot x$$

$$\boxed{\text{GCF} : x^2}$$

$$y \& y^3 : \cdot y = y$$
$$\cdot y^3 = y \cdot y \cdot y$$

$$\boxed{\text{GCF} = y}$$

$$a^2b^3 \& ab^2 :$$

$$\boxed{\text{GCF} = ab^2}$$

Factoring Polynomials by GCF

Name: _____ Date: _____

★ "Factor" simply means to **UNDISTRIBUTE**. ★

Distributed Version	Factored Version
$5x^2 + 15x$	$5x(x + 3)$
$2x^3 - 8x^2$	$2x^2(x - 4)$
$2x^2 - 4x$	$2x(x - 2)$
$15x^2 - 5x + 30$	$5(3x^2 - x + 6)$

More formal Definition:

⊙ **Factoring:** Writing the polynomial as a product.

Steps to Factoring Out a GCF:

1. Find the GCF of all its terms (number and/or variables).
2. Write the polynomial as a product by factoring out the GCF from all the terms.
 $\text{monomial} \rightarrow \text{GCF (Factor "leftovers")} \text{ Polynomial}$
 - This is done by dividing the original terms of the polynomial by the GCF.
3. The remaining factors in each term will form a polynomial.
 $* \text{"leftover" polynomial should have same}$

Examples as a class: # of terms as original problem

⊙ $4x + 6y$

$$\boxed{2(2x + 3y)}$$

⊙ $6x^3 - 9x^2 + 12x$

$$\boxed{3x(2x^2 - 3x + 4)}$$

⊙ $10c^2d^2 - 15cd^3$

$$5cd^2(2c - 3d)$$

⊙ $6x^2yz + 2xy^2z - 4xyz$

$$2xyz(3x + y - 2)$$

Try the following.

1. $8x - 12y$

$$4(2x - 3y)$$

2. $a^3 + 2a^2 - a$

$$a(a^2 + 2a - 1)$$

3. $14mn - 7m^2n + 21mn^2$

$$7mn(2 - m + 3n)$$

4. $3x - 9x^2$

$$3x(1 - 3x)$$
